### **Introduction**

When one considers critically and realistically, all the advancements achieved in the overall area of restorative dentistry, a glaring exception comes to the fore; that exception is the technique for the preparation of teeth and the philosophy behind it. The approach to preparations has not kept pace with other advances in dentistry. Almost all dental literature, dental school teaching, essayists, programs and philosophies of dentists demonstrate this traditional holdover.

Teeth require preparation to receive restorations, and these preparations must be based on fundamental principles from which basic criteria can be developed that help predict the success of prosthodontic treatment.

The principles of tooth preparation may be divided into three broad categories:

- 1) Biologic considerations.
- 2) Mechanical considerations.
- 3) Esthetic considerations.
